

Customer Success Training Design Brief

Protected portfolio artifact - design proof, not courseware

Created by Cernice Robinson to demonstrate training strategy, customer success operating logic, KPI translation, adult-learning design, and structured enablement without releasing proprietary lessons, worksheets, scoring logic, facilitator guides, answer keys, or capstone assets.

What this proves

Curriculum architecture | KPI alignment | Scenario-based learning | Account health thinking
Assessment design | Facilitation planning | Adoption strategy | Executive communication

Public-safe sample: synthetic framing only. Full training remains protected.

1. Design purpose and ownership

This brief is a public-safe portfolio artifact created by Cernice Robinson. It is intentionally designed to show the skill behind the customer success training system without releasing the class itself. The artifact demonstrates how I think through curriculum structure, business outcomes, learner behavior, account health, retention risk, measurement, and implementation planning.

The training system was built to help customer-facing teams move from reactive service behavior to structured customer success behavior: diagnosing account health, translating usage and risk signals, improving QBR discipline, escalating with context, and connecting customer outcomes to business metrics.

Protected boundary

This file is a design brief only. It does not include the full module workbook, worksheets, scenario data, scoring formulas, facilitator guide, answer keys, learner exercises, or capstone project instructions.

Public artifact includes	Protected material intentionally withheld
Training architecture, learning strategy, competency map, sample module blueprint, assessment approach, implementation roadmap, and governance model.	Full lessons, activity prompts, proprietary worksheets, scoring logic, facilitator notes, detailed scenarios, capstone packet, templates, and answer keys.

Professional skills demonstrated

- Instructional design for business and customer success operations.
- Ability to translate account management concepts into trainable operating behaviors.
- KPI alignment across account health, adoption, risk, renewal readiness, and stakeholder engagement.
- Scenario-based learning design using synthetic business cases and protected materials.
- Executive communication: showing enough structure for credibility without oversharing course content.

2. Training architecture

The system was designed as an 11-module customer success curriculum. The public view names the capability areas only. The deeper lesson content, exercises, examples, and scoring logic remain protected.

Module	Capability area	What the learner practices
01	KPI Audit & Account Health	How to read customer status through measurable signals.
02	Onboarding & First Value	How early handoffs shape adoption and trust.
03	Segmentation Strategy	How to prioritize accounts by complexity, value, and risk.
04	Adoption Signals	How to separate true usage from noisy activity.
05	QBR / EBR Cadence	How to structure executive business reviews around outcomes.
06	Escalation Management	How to move from emotion to facts, ownership, and next steps.
07	Renewal Risk Planning	How to identify threats before the renewal window.
08	Cross-Functional Operations	How CS partners with sales, support, finance, product, and ops.
09	Voice of Customer	How to collect, categorize, and route customer feedback.
10	CS Dashboards	How to build visibility around customer health and action.
11	Capstone Operating System	How learners combine the tools into a repeatable CS rhythm.

Design principle

Each module is built around a practical operating question, not an academic lecture. The goal is for learners to leave with better judgment, clearer account visibility, and repeatable behaviors they can use in real customer conversations.

3. Competency map

The curriculum was mapped to business competencies instead of isolated topics. This makes the training easier to connect to leadership expectations, performance coaching, and customer outcomes.

Competency	Behavior being developed	Evidence of learning
Account Health Judgment	Identify risk patterns, adoption gaps, stakeholder drift, and service friction before they become renewal problems.	Health score reasoning, risk notes, next-best-action clarity.
Outcome Communication	Explain customer value in plain business language instead of activity summaries.	QBR narrative, stakeholder updates, executive summaries.
Operational Discipline	Use cadence, documentation, escalation paths, and follow-up controls to prevent account drift.	Cadence adherence, task aging, closed-loop ownership.
Data Translation	Turn dashboards and KPI movement into interpretation, action, and prioritization.	Signal interpretation, account segmentation, action plans.
Cross-Functional Influence	Coordinate sales, support, operations, finance, and leadership around customer outcomes.	Escalation quality, handoff clarity, decision logs.
Renewal Readiness	Build account plans that reduce surprise, surface risk early, and protect customer value.	Renewal risk narrative, stakeholder map, mitigation plan.

Why this matters

Customer success training often fails when it teaches vocabulary without changing operating behavior. This design ties learning to observable behaviors: how learners analyze accounts, frame customer risk, communicate value, and manage follow-through.

4. Sample module blueprint - protected view

The following is a controlled blueprint view. It shows the instructional design logic without giving away the lesson, worksheet, scoring model, or activities. This proves the work without turning the downloadable file into a ready-made class.

Design element	Protected sample view
Module purpose	Help learners evaluate account health using measurable signals, customer context, and documented next steps.
Learning outcome	Learner can distinguish healthy, watchlist, and at-risk accounts using evidence instead of instinct alone.
Core teaching move	Move from "customer seems fine" to a structured risk narrative built from KPI signals, stakeholder behavior, and operational friction.
Scenario type	Synthetic customer/account scenario. Company names, metrics, notes, and issues are fictional.
Practice activity	REDACTED - activity instructions and worksheet logic are withheld.
Scoring method	REDACTED - rubric details and scoring formula are withheld.
Facilitator prompts	REDACTED - discussion guide and answer key are withheld.
Business connection	Links customer health thinking to retention, escalation quality, QBR preparation, and leadership visibility.

Skill being demonstrated

This blueprint shows that I can design learning around business judgment. The value is not just the topic list; the value is the operating logic underneath the training.

5. Assessment strategy

The training is designed to show progression from understanding to application. Learners should not only repeat definitions; they should demonstrate how they would diagnose an account, explain risk, prioritize action, and communicate with stakeholders.

Assessment layer	What it proves	Public-safe example
Knowledge check	Learner understands key concepts and terminology.	Short checks after each module. Questions are not included in this public file.
Scenario judgment	Learner can interpret incomplete customer information.	Synthetic account brief with selected signals. Full scenario withheld.
Action planning	Learner can turn analysis into next steps.	Account action plan template exists, but template fields and scoring logic are protected.
Communication practice	Learner can explain risk and value clearly.	QBR or stakeholder update prompt exists, but scripts and examples are withheld.
Capstone	Learner can combine account health, adoption, escalation, dashboard, and renewal thinking.	Capstone concept is described; full packet is not released.

Rubric categories - excerpt only

Category	What is evaluated	Status
Signal interpretation	Uses account evidence instead of vague opinion.	Public category only
Risk narrative	Explains why the account needs attention.	Public category only
Next-best-action	Connects insight to ownership, timing, and follow-up.	Public category only
Executive clarity	Communicates in concise business language.	Public category only

6. Implementation and facilitation plan

A training system only works if it can be delivered, reinforced, and measured. This design includes a practical rollout structure that could support a live cohort, self-paced learning, or manager-led team enablement.

Phase	Leader action	Measurement focus
Prepare	Confirm learner audience, business pain points, and success measures.	Baseline confidence, current account review quality, manager priorities.
Launch	Introduce why customer success behaviors matter to revenue and retention.	Participation, completion, learner questions, early friction.
Practice	Use synthetic scenarios and guided analysis to build judgment.	Quality of diagnosis, clarity of next steps, escalation thinking.
Apply	Learners translate concepts into a sample account plan or review rhythm.	Completeness, prioritization, business language, follow-through.
Reinforce	Managers coach using common language and operating expectations.	Sustained behavior, scorecard adoption, improved account visibility.

Facilitation approach

- Use short teaching segments followed by scenario practice.
- Keep examples synthetic so the training can be shared safely across teams.
- Coach learners to explain evidence, risk, and next steps in plain business language.
- Use manager debriefs to turn learning into operating rhythm, not one-time exposure.

7. Measurement model

The training system connects learning to operational indicators. The goal is not only class completion; it is stronger account management behavior after the class.

Metric area	What leaders can watch	Why it matters
Account health visibility	Completeness and quality of account health notes.	Improves early risk detection and manager coaching.
QBR readiness	Use of outcomes, risks, adoption signals, and next steps.	Raises the quality of executive customer conversations.
Escalation quality	Clarity of issue, owner, timeline, customer impact, and decision needed.	Reduces noise and speeds resolution.
Renewal risk planning	Risk narratives created before renewal pressure peaks.	Reduces surprise and strengthens retention discipline.
Dashboard interpretation	Learner ability to explain KPI movement and action implications.	Turns reporting into decision support.

Portfolio value

For hiring teams, this artifact shows more than customer success knowledge. It shows curriculum design, operational thinking, leadership communication, KPI translation, and judgment about confidentiality.

8. What remains protected

The public version is intentionally useful as evidence, not usable as a complete training product. This protects the intellectual property while still demonstrating the professional skill behind the work.

Protected asset	Reason withheld
Full Module 01 workbook	Would allow someone to recreate the opening class experience.
Learner worksheets	Contain the practical exercises and learning transfer tools.
Scenario data and account packets	Drive the actual decision-making practice inside the course.
Scoring model and answer keys	Would reveal the assessment engine behind the training.
Facilitator guide	Contains teaching notes, debrief prompts, and classroom flow.
Capstone packet	Combines the full course logic into the final deliverable.
Templates and examples	Represent reusable product assets, not just proof of work.

Closing statement

Created by Cernice Robinson. This protected portfolio brief demonstrates the architecture and business logic behind a customer success training system while preserving the full intellectual property of the class.
